

1. Problem: B2B order jumps too quickly to bulk production

Our currently identified problem

Our previous flow was:

Inquiry → Negotiation → Agreement → Order → Production

The weakness is that a large B2B buyer may commit to hundreds of products without any intermediate validation.

Claude's contribution

Claude identified that the overall lifecycle needs **failure/exception handling**, but did not consider a sample stage mandatory.

Gemini's contribution

Gemini specifically identified:

Sample Order → Buyer Approval → Bulk Production

as a missing B2B procurement step.

Combined conclusion

We should **not make sampling mandatory for every order**.

Instead:

CraftConnect supports an optional Sample Approval stage for high-volume/customized orders.

Final solution

Buyer Requirement

Matching

Inquiry

Terms Discussion

Sample Required?

Example

Hotel wants **500 bamboo baskets with its logo**.

Instead of immediately producing 500:

Buyer requests 1 sample.

Artisan makes 1.

Buyer approves:

“Shape, size and logo are correct.”

Then the 500-unit production order begins.

Why this matters: It reduces the risk of a large order being wrong before bulk production.

2. Problem: Artisan needs money to start bulk production

This is one of the **strongest genuine gaps**.

Claude

Claude says the flow currently has no payment/security checkpoint before production and recommends explicit payment terms and payment-status tracking.

Claude specifically recommends **not building actual escrow** for the MVP.

Gemini

Gemini went further and proposed:

30% raw material → 50% production QC → 20% final delivery.

Combined conclusion

We take the **concept from Gemini**:

Payment should be milestone-based.

But take **Claude's implementation approach**:

CraftConnect tracks payment commitments/status; it doesn't become an escrow/financial institution.

Final solution

Agreement

Payment Terms

Advance Pending

Advance Confirmed

Production

Dispatch / Delivery

Balance Settlement

The exact percentages can be agreed between buyer and artisan rather than hard-coded to 30/50/20.

Example

Order = ₹3,00,000.

Buyer and artisan agree:

30% before production

50% on dispatch

20% after delivery

CraftConnect shows:

₹90,000 Advance — Received ✓

Now artisan can start procuring material.

Later:

₹1,50,000 Dispatch Milestone — Pending

Then:

₹60,000 Final — Pending

So the app gives both sides a **clear payment state**.

3. Problem: Production has no quality checkpoint

Our problem

Previously:

Order → Production → Ready

There was no visibility during production.

Gemini

Gemini suggested:

Mid-production photo → AI/Buyer validation → next payment milestone

Claude

Claude intentionally keeps production tracking simple:

Not Started → In Progress → Ready.

It warns against building a complete manufacturing tracking system.

Combined conclusion

We don't build a manufacturing-management system.

We add **one optional production checkpoint** for relevant B2B orders.

Final solution

Production Started

Progress Check

Photo / Update

Buyer or Admin Review

Continue Production

Ready

AI can **assist in flagging inconsistencies**, but we should not claim:

“AI guarantees product quality.”

Example

Buyer ordered 500 baskets.

After 250 are produced, artisan uploads a photo.

CraftConnect records:

Production Checkpoint: 50%

Buyer sees the progress and can flag an issue if the design differs from the agreed specification.

4. Problem: “Dispatch” is too vague

This was identified strongly by **both reviews**.

Gemini

Suggested:

- AI packaging checklist
- packaging photo
- shipping label
- tracking ID
- 3PL integration
- consolidation point for cluster orders

Claude

More conservative:

- define who packages
- define who ships
- artisan-booked courier for smaller orders
- tracking/reference number
- consolidation point for bulk/multi-artisan orders
- don't build logistics infrastructure.

Combined final solution

We keep:

AI-Assisted Fulfilment

READY

Packaging Checklist

Packaging Photo

Shipping Method

Shipping Label / Reference

Tracking ID

DISPATCHED

IN TRANSIT

DELIVERED

CraftConnect **doesn't operate logistics.**

It helps the artisan complete and track the process.

Example

Artisan is shipping fragile ceramic lamps.

CraftConnect:

Packaging checklist

✓ Cushioning added

✓ Inner product secured

✓ Outer box sealed

 Upload package photo

Then:

Enter shipping reference / generate label through supported logistics integration.

Then buyer can see:

Dispatched → In Transit → Delivered

5. Problem: What happens when something goes wrong?

This is something **Claude identified particularly well**.

Our original flow assumed everything goes perfectly.

Real B2B doesn't.

Possible situations:

- buyer says product quality is wrong
- artisan cannot fulfil quantity
- shipment is damaged
- buyer cancels
- quantity received is incorrect
- payment milestone is disputed

Claude recommends a simple:

Flag an Issue → Admin

rather than building an automated dispute-resolution engine.

Final solution

At appropriate order stages:

 **Flag an Issue**

↓

Admin receives:

- order details
- agreed terms
- payment status
- production status
- fulfilment information
- uploaded evidence

↓

Admin investigates manually.

Example

Buyer ordered 500.

Only 470 arrive.

Buyer taps:

Report Issue

Selects:

Quantity mismatch

Uploads photo.

Admin sees the case and handles the resolution.

This prevents our B2B lifecycle from having a “**happy path only.**”

6. Problem: Buyer needs a way to inspect before final completion

Gemini suggested a **48-hour inspection window**.

Claude's flow goes directly:

Delivery Confirmation → Balance Payment → Completion.

Combined decision

We can keep:

Buyer Inspection / Issue Window

without building a sophisticated dispute engine.

Final solution

DELIVERED

Buyer Inspection

Satisfied?

YES

NO

Complete

Flag Issue

The exact time window can be **configurable**, rather than permanently claiming 48 hours as a universal B2B rule.

7. Problem: B2B Readiness is confusing

Both reviews strongly support this.

Currently:

B2B Ready

is ambiguous.

Ready **for what?**

Final solution

Two separate states:

① **CraftConnect B2B Ready**

Means:

Product is ready to be discovered and purchased by buyers inside CraftConnect.

- ✓ Images
- ✓ Description
- ✓ Price
- ✓ MOQ
- ✓ Capacity
- ✓ Lead Time
- ✓ Availability

② **External Channel Ready**

Means:

Product has the information required for a specific external channel.

For example:

CraftConnect ✓
External Channel A ?
External Channel B ?
Government Channel ?

This keeps our database and UI clean.

Claude explicitly recommends these as separate states.

8. Problem: Negotiation is too unstructured

This came from Gemini's review and fits our AI architecture very well.

Instead of:

Buyer: "Can you do 500 by next month?"

Artisan: "Maybe."

Buyer: "What about ₹600?"

We structure the commercial information.

Final solution

Quantity

MOQ

Unit Price

Target Date

Lead Time

Customization

Delivery Terms

Payment Terms

Specifications

Then:

Voice / Chat can still be used for discussion.

AI converts the conversation into structured fields.

Example

Artisan says in Hindi:

"500 bana dunga, lekin 30 din mein nahi, 40 din lagenge."

CraftConnect extracts:

Quantity: 500

Capacity: Available
Lead Time: 40 days
Requested Lead Time: 30 days
Status: Needs negotiation

This is a **very strong use of AI** because AI isn't just generating text — it's converting natural human communication into usable B2B data.

9. Problem: “Repeat Business” was just a label

Claude caught this.

We previously ended with:

Repeat Business

But how?

Claude recommends an explicit reorder mechanism.

Final solution

After completion:

Order Completed

Saved Supplier

Order History

"Reorder"

Example

Hotel previously bought:

500 baskets from Meena.

Six months later:

Reorder previous order

Tap → quantity changes to 700 → new requirement generated.

This is valuable because **B2B isn't only about finding a buyer once; it's about creating repeat supplier relationships.**

10. Problem: Bidding can distract from the core product

Both reviews agree.

Final decision

Future / Optional

Not part of our primary B2B flow.

If included in the vision:

Artisan-initiated Bulk Clearance

Example:

Artisan has 80 surplus baskets.

They can eventually post:

Bulk Clearance — 80 units

to eligible/pre-verified buyers.

But **we don't build the live bidding engine for MVP.**

Claude explicitly recommends keeping bidding outside the main flow.

11. So THIS is our final problem set

Now, after combining both reviews, I would group everything into **6 actual problems** instead of presenting 15 tiny problems.

Problem 1 — Digitalization Barrier

Artisan has a physical product but struggles to create a professional digital B2B listing.

Solution

AI Product Digitization

Photo + Voice → AI → Catalogue → Verification → Pricing.

Problem 2 — B2B Discovery & Capability Mismatch

A buyer may need a specific quantity, deadline, customization and price, but ordinary product discovery doesn't necessarily determine which artisan can actually fulfil it.

Solution

AI Requirement Understanding + Capability-Based Matching

Requirement → AI structures it → Match using:

Craft + Product + MOQ + Capacity + Lead Time + Price + Customization + Availability

Problem 3 — Communication & Negotiation Barrier

Buyer speaks in formal/commercial B2B language while artisan may prefer regional language and voice.

Solution

AI Business Manager

Buyer requirement → simplified regional voice/text → artisan response → structured B2B terms.

Problem 4 — B2B Transaction Risk

Bulk orders create risk around:

- samples
- payment before production
- production visibility
- quality issues
- disputes

Solution

Protected B2B Workflow

Sample*

Structured Agreement

Payment Terms

Production

Progress Check*

Delivery

Inspection

Completion

* optional depending on order.

Problem 5 — Fulfilment Complexity

Artisan may struggle with packaging, shipping and tracking.

Solution

AI-Assisted Fulfilment

Packaging checklist → packaging verification → shipping reference → tracking → delivery.

CraftConnect coordinates the workflow, **not the physical logistics infrastructure**.

Problem 6 — Ecosystem / Marketplace Fragmentation

Artisan may become B2B-ready inside CraftConnect but still have different requirements for external channels.

Solution

Dual Readiness + Integration Layer

Product

Actual automated external push remains future scope unless official integration access exists.

12. And the FINAL CraftConnect solution becomes

And alongside this:

The important part

We have NOT changed the original CraftConnect idea.

We've strengthened the places where the original lifecycle was weak.

The core remains:

AI helps an artisan become digitally B2B-ready → AI finds the right buyer/artisan match → AI bridges the communication gap → CraftConnect supports the transaction through fulfilment and repeat business.

That's the version I'd now use as the **baseline architecture for all further research and solution design.**
